9. Future Design Extensions

Future versions can add login, plan history, reminders, voice interaction, progress dashboards, structured JSON output and integration with suitable external activity data.

Tabulation

Testing	Purpose
Functional test	Check each feature
AI test	Check generated response
UI test	Check readability
Documentation	Record implementation and results

Coding / Technical Example

```
# FitBuddy technical flow
user_input = {
    "experience": "beginner",
    "activity": "walking",
    "time": "30 minutes"
}

prompt = f"Create a general wellness plan for {user_input}"
# Send prompt to Gemini from the secure backend.
# Display the generated response in the UI.
```

Picture / Diagram

```
CURRENT SYSTEM → TESTING → DOCUMENTATION → FUTURE FEATURES
```

Project Summary

FitBuddy – AI Fitness Plan Generator using Gemini Models is an academic Generative AI project demonstrating brainstorming, requirements analysis and project design. It can be implemented as a web application using Python/Flask, HTML/CSS/JavaScript, Gemini API integration and an optional database.

Note: FitBuddy should be presented as a general wellness/educational application, not as a medical diagnosis or treatment system.
